Supplementary Figure 1. Relationships between esophageal baseline impedance (BI) and number of acid reflux without a post-reflux swallow-induced peristaltic wave (PSPW). (A) Esophageal BI (ohm) at 3 cm above the lower esophageal sphincter (LES) was significantly but weakly correlated with acid reflux without a PSPW ($r = -0.267$, $P = 0.001$). (B) Esophageal BI (ohm) at 5 cm above the LES was significantly but weakly correlated with acid reflux without a post-reflux swallow-induced peristaltic wave ($r = -0.283$, $P = 0.001$).
